Authors are encouraged to submit new papers to INFORMS journals by means of a style file template, which includes the journal title. However, use of a template does not certify that the paper has been accepted for publication in the named journal. INFORMS journal templates are for the exclusive purpose of submitting to an INFORMS journal and are not intended to be a true representation of the article's final published form. Use of this template to distribute papers in print or online or to submit papers to another non-INFORM publication is prohibited.

1. Related Work

1.1. Image Postprocessing

Accordingly, these rules allow reducing the number of potential TS regions which helps accelerating the process and improving the accuracy. These regions are going to be the input of the next classifying step Figure

1. Divide the surrounding region into several blocks and set a initial label teach block.
2. Settleable of each block interregional orthographic sign to s , and exclude them from the following process.
3. Merge adjacent blocks if the Euclidean distance of the average L^*a*b^* value between the blocks is smaller than a threshold.
4. Iterate the above process until convergence is reached.

Therefore, for every potential region, we checked the following rules:

- The height and the width of every potential TS region should be greater than 14 and lower than 100.
- The area of every potential TS region has to be greater than 30% and less than 80% of the corresponding minimum bounding box area.
- The rate of height and width of a potential TS should be an interval of $[0.5, 1.5]$.

1.2. Segmentation of surrounding region

Accordingly, these rules allow reducing the number of potential TS regions which helps accelerating the process and improving the accuracy. These regions are going to be the input of the next classifying step Figure (1).

1.3. Hough Transformation

The median filter is applied to the entire image, including those parts that are not affected by the noise. An image filtered by the median filter can be defined by.

$$L = \sum V^2 iNet(I_i; W) - S_i^2, i = 1, \text{where } O_{a,e} - \text{circle} \quad (1)$$

$$G(x, y) = \frac{1}{2\pi\delta^2} * e^{-\frac{x^2 + y^2}{2 * \delta^2}}, \text{where } \delta \text{ is frequency} \quad (2)$$

Processing time for the overall system is analyzed in this section. The details on time required for each phase are listed in Formula (1). The processing time for the system is 0.134s with 0.122s for process phase and 0.012s for classification Figure (2). With an average processing time of 0.134s, the system could be applied in real-time application.

$$E(V, h) = \sum_{i=1} V_i^2 - \left(\sum_{k=1} b_k h_k + \sum_{i=1} w_i V_i h_k \right) \quad (3)$$

Normalization	0.069

This proposed classification system with the integration of AI and image processing techniques gave a satisfying performance system comprises of Neural network classifier presented here Formula(3). The proposed system is tested with a dataset consist of different lighting condition which has high illumination effect, shadowing effect from physical objects and occlusion due to weather. With a 0.134s processing time, the traffic signs are extracted from the image and classified Table (1). An accuracy of 84.4% is achieved by the system. From the experimental result, it shows that the system able to overcome most of the illumination effect in the Figure(2). However, highly distorted image due to illumination and shadowing effect, color temperature created by image normalization due to noisy background will tend to make the system fail to detect the traffic signs. In classification phase, traffic signs only classified according to its shape. Feature such as recognizing the exact sign would be a big leap in classification as currently only few signs can be recognized. Furthermore, due to lack of available dataset of Malaysian traffic sign, the evaluation of the system is only done with the dataset from Swedish. Hence, to implement the system within Malaysia or at international level, different dataset should be used for developing the system.
